THIS PAGE BLANK (USPTO)

Synergistic Mixtures of UV-Absorbers in Polyolefins

The present invention relates to novel polyolefin compositions which contain mixtures of different UV absorbers.

The effects of atmospheric oxygen, moisture and, in particular, UV light result in degradation of the polymer material. This manifests itself, for example, in the loss of mechanical strength, changes in shade and finally total breakdown of the polymer article. As is known, it is possible to retard such degradation processes in polyolefins by the use of suitable stabilizers, and there are numerous prior art documents in this field.

In the coatings field, EP-A-0453 396 discloses that mixtures of hydroxyphenyl-benzotriazole with hydroxybenzophenone or with hydroxyphenyl-s-triazine UV-absorbers lead to synergistic mixtures which prevent the coatings life time unexpectedly long from degradation.

Although there are prior art documents, such as FR 2619 814, which generically disclose the combined use of oxalamide UV absorbers, particularly in coatings, with benzophenone or benzotriazole UV absorbers, there is however no suggestion in the prior art for the instant combinations in polyolefins.

It has now been found that certain combinations of UV absorbers of different chemical structures are capable of substantially preventing the degradation of polyolefins.

The combinations of the present invention provide an unexpected synergistic stabilization effect for polyolefin articles. The effect is not predictable from the absorption spectra and has not been observed with other UV absorber combinations in polyolefins.

One subject of the present invention is a polyolefin composition which comprises as UV absorber a mixture of

- a) at least one hydroxybenzophenone and at least one 2-hydroxyphenylbenzotriazole with the proviso that the polyolefin is a high density polyethylene or a polypropylene of the "Phillips" type or a polyethylene or polypropylene of the metallocene type and no polyvinylpyridin is present;

- b) at least one hydroxybenzophenone and at least one 2-hydroxyphenyltriazine, with the proviso that if the polyolefin is polypropylene, no polyvinylpyridin is present
- c) at least one hydroxybenzophenone and at least one oxanilide;
- d) at least one 2-hydroxyphenylbenzotriazole and at least one oxanilide;
- e) at least one 2-hydroxyphenyltriazine and at least one oxanilide;
- f) at least one hydroxybenzophenone, at least one 2-hydroxyphenylbenzotriazole and at least one oxanilide;
- g) at least one hydroxybenzophenone, at least one 2-hydroxyphenylbenzotriazole and at least one 2-hydroxyphenyltriazine, with the proviso that if the polyolefin is polypropylene, no polyvinylpyridin is present;
- h) at least one hydroxybenzophenone, at least one oxanilide and at least one 2-hydroxyphenyltriazine; or
- i) at least one 2-hydroxyphenylbenzotriazole, at least one oxanilide and at least one 2-hydroxyphenyltriazine.

Suitable polyolefins are mentioned below.

1. Polymers of monoolefins and diolefins, for example polypropylene, polyisobutylene, polybut-1-ene, poly-4-methylpent-1-ene, polyisoprene or polybutadiene, as well as polymers of cycloolefins, for instance of cyclopentene or norbornene, polyethylene (which optionally can be crosslinked), for example high density polyethylene (HDPE), high density and high molecular weight polyethylene (HDPE-HMW), high density and ultrahigh molecular weight polyethylene (HDPE-UHMW), medium density polyethylene (MDPE), low density polyethylene (LDPE), linear low density polyethylene (LLDPE), (VLDPE) and (ULDPE), metallocene polyethylene (m-PE) in particular m-LLDPE and metallocene polypropylene (m-PP).

Polyolefins, i.e. the polymers of monoolefins exemplified in the preceding paragraph, preferably polyethylene and polypropylene, can be prepared by different, and especially by the following, methods:

- a) radical polymerisation (normally under high pressure and at elevated temperature).
- b) catalytic polymerisation using a catalyst that normally contains one or more than one metal of groups IVb, Vb, VIb or VIII of the Periodic Table. These metals usually have one or more than one ligand, typically oxides, halides, alcoholates, esters,

- 3 -

ethers, amines, alkyls, alkenyls and/or aryls that may be either π - or σ -coordinated.

- These metal complexes may be in the free form or fixed on substrates, typically on activated magnesium chloride, titanium(III) chloride, alumina or silicon oxide. These catalysts may be soluble or insoluble in the polymerisation medium. The catalysts can be used by themselves in the polymerisation or further activators may be used, typically metal alkyls, metal hydrides, metal alkyl halides, metal alkyl oxides or metal alkyloxanes, said metals being elements of groups Ia, IIa and/or IIIa of the Periodic Table. The activators may be modified conveniently with further ester, ether, amine or silyl ether groups. These catalyst systems are usually termed Phillips, Standard Oil Indiana, Ziegler (-Natta), TNZ (DuPont), metallocene or single site catalysts (SSC).

Preferred are Phillips and metallocene type polyolefins. In particular polyethylene and polypropylene prepared with these catalysts.

2. Mixtures of the polymers mentioned under 1), for example mixtures of polypropylene with polyisobutylene, polypropylene with polyethylene (for example PP/HDPE, PP/LDPE) and mixtures of different types of polyethylene (for example LDPE/HDPE), metallocene types with conventional types (for example m-PE/PE-LLD, m-PE/PE-LD, m-PP/conventional PP).

Preferably the polyolefin is polyethylene or polypropylene.

Preferred UV-absorber mixtures are:

- a) at least one hydroxybenzophenone and at least one 2-hydroxyphenylbenzotriazole with the proviso that the polyolefin is a high density polyethylene or a polypropylene of the "Phillips" type or a metallocene polyethylene or polypropylene and no polyvinylpyridin is present;
- b) at least one hydroxybenzophenone and at least one 2-hydroxyphenyltriazine, with the proviso that if the polyolefin is polypropylene, no polyvinylpyridin is present and;
- e) at least one 2-hydroxyphenyltriazine and at least one oxanilide.

Preferred polyolefin compositions are wherein the hydroxybenzophenone is of formula I

the 2-hydroxyphenylbenzotriazole is of formula IIa, IIb or IIc

the 2-hydroxyphenyltriazine is of formula III

and the oxanilide is of formula (IV)

Furthermore, in addition to phenylalkyl having 1 to 4 carbon atoms in the alkyl moiety, for example benzyl, R_1 can also be cycloalkyl having 5 to 8 carbon atoms, for example

cyclopentyl, cyclohexyl and cyclooctyl, or a radical of the formula $\begin{array}{c} R_4 \\ | \\ -C- \\ | \\ R_5 \end{array} C_n H_{2n+1-m} - M_m$ in

which R_4 and R_5 independently of one another are alkyl having in each case 1 to 5 carbon atoms, in particular methyl, or R_4 , together with the $C_n H_{2n+1-m}$ radical, forms a cycloalkyl radical having 5 to 12 carbon atoms, for example cyclohexyl, cyclooctyl and cyclodecyl. M is a radical of the formula $-COOR_6$ in which R_6 is not only hydrogen but also alkyl having 1 to 12 carbon atoms or alkoxyalkyl having 1 to 20 carbon atoms in each of the alkyl and alkoxy moieties. Suitable alkyl radicals R_6 are those enumerated for R_1 . Examples of suitable alkoxyalkyl groups are $-C_2H_4OC_2H_5$, $-C_2H_4OC_8H_{17}$ and $-C_4H_8OC_4H_9$. As phenylalkyl having 1 to 4 carbon atoms, R_6 is, for example, benzyl, cumyl, α -methylbenzyl or phenylbutyl.

In addition to hydrogen and halogen, for example chlorine and bromine, R_2 can also be alkyl having 1 to 18 carbon atoms. Examples of such alkyl radicals are indicated in the definitions of R_1 . R_2 can also be phenylalkyl having 1 to 4 carbon atoms in the alkyl moiety, for example benzyl, α -methylbenzyl and cumyl.

At least one of the radicals R_1 and R_2 must be other than hydrogen.

In addition to hydrogen or chlorine, R_3 is also alkyl or alkoxy having in each case 1 to 4 carbon atoms, for example methyl, butyl, methoxy and ethoxy, and also $-COOR_6$.

In the compounds of the formula (IIb) T is hydrogen or alkyl having 1 to 6 carbon atoms, such as methyl and butyl, T₁ is not only hydrogen or chlorine, but also alkyl or alkoxy having in each case 1 to 4 carbon atoms, for example methyl, methoxy and butoxy, and, if n is 1, T₂ is chlorine or a radical of the formula -OT₃ or -NT₄T₅. T₃ is here hydrogen or alkyl having 1 to 18 carbon atoms (cf. the definition of R₁). These alkyl radicals can be substituted by 1 to 3 hydroxyl groups or by a radical -OCOT₆. Furthermore, T₃ can be alkyl having 3 to 18 carbon atoms (cf. the definition of R₁) which is interrupted once or several times by -O- or -NT₆- and is unsubstituted or substituted by hydroxyl or -OCOT₆. Examples of T₃ as cycloalkyl are cyclopentyl, cyclohexyl or cyclooctyl. T₃ can also be alkenyl having 2 to 18 carbon atoms. Suitable alkenyl radicals are derived from the alkyl radicals enumerated in the definitions of R₁. These alkenyl radicals can be substituted by hydroxyl. Examples of T₃ as phenylalkyl are benzyl, phenylethyl, cumyl, α-methylbenzyl or benzyl. T₃ can also be a radical of the formula

Like T₃, T₄ and T₅ can, independently of one another, be not only hydrogen but also alkyl having 1 to 18 carbon atoms or alkyl which has 3 to 18 carbon atoms and is interrupted once or several times by -O- or -NT₆-. T₄ and T₅ can also be cycloalkyl having 5 to 12 carbon atoms, for example cyclopentyl, cyclohexyl and cyclooctyl. Examples of T₄ and T₅ as alkenyl groups can be found in the illustrations of T₃. Examples of T₄ and T₅ as phenylalkyl having 1 to 4 carbon atoms in the alkyl moiety are benzyl or phenylbutyl. Finally, these substituents can also be hydroxyalkyl having 1 to 3 carbon atoms.

If n is 2, T₂ is a divalent radical of the formula

In addition to hydrogen, T₆ (see above also) is alkyl, cycloalkyl, alkenyl, aryl or phenylalkyl; examples of such radicals have already been given above.

In addition to hydrogen and the phenylalkyl radicals and long-chain alkyl radicals mentioned above, T₇ can be phenyl or hydroxyphenyl and also -CH₂OT₈ in which T₈ can be one of the

alkyl, alkenyl, cycloalkyl, aryl or phenylalkyl radicals enumerated.

The divalent radical T_9 can be alkylene having 2 to 8 carbon atoms, and such radicals can also be branched. This also applies to the alkenylene and alkynylene radicals T_9 . As well as cyclohexylene, T_9 can also be a radical of the formula -

T_{10} is a divalent radical and, in addition to cyclohexylene, is also alkylene which has 2 to 20 carbon atoms and which can be interrupted once or several times by -O-. Suitable alkylene radicals are derived from the alkyl radicals mentioned in the definitions of R_1 .

T_{11} is also an alkylene radical. It contains 2 to 8 carbon atoms or, if it is interrupted once or several times by -O-, 4 to 10 carbon atoms. T_{11} is also 1,3-cyclohexylene, 1,4-cyclohexylene, 1,3-phenylene or 1,4-phenylene.

Together with the two nitrogen atoms, T_6 and T_{10} can also be a piperazine ring.

Examples of alkyl, alkoxy, phenylalkyl, alkylene, alkenylene, alkoxyalkyl and cycloalkyl radicals and also alkylthio, oxaalkylene or azoalkylene radicals in the compounds of the formulae (2), (3) and (4) can be deduced from the above statements.

The UV absorbers of the formulae (I), (IIa), (IIb), (III), and (IV) are known per se and are described, together with their preparation, in, for example, EP-A-323 408, EP-A-57 160, US Patent Application Serial No. 07/446 369 (prio.: 5.12.89), US-A 4 619 956, DE-A 31 35 810 and GB-A 1 336 391. Preferred meanings of substituents and individual compounds can be deduced from the documents mentioned. They can be incorporated into polyolefins by customary methods which are known per se. The preparation may be carried out in a manner known per se by mixing the said components and, if desired, further additives with the polymer using devices known per se, such as calenders, mixers, kneaders, extruders and the like. The additives may be added individually or in admixture with one another. It is also possible to use so-called master batches.

In certain cases it can be advantageous to use even a mixture of compounds of all 4 classes of UV-absorbers (hydroxybenzophenone, 2-hydroxyphenyltriazine, oxanilide and 2-hydroxyphenylbenzotriazole).

The polyolefin composition obtainable according to the present invention can be made into the desired form in known manner. Such processes include, for example, grinding, calendering, extruding, injection-moulding, sintering, compression/sintering or spinning, also extrusion blow-moulding.

The amounts of UV absorber to be selected can depend on the nature of the polyolefin composition and the requirements for its stability. The individual UV absorber components can be added on their own or as a mixture to the appropriate polyolefin compositions. The customary other additives, such as processing stabilizers, antioxidants and other light stabilisers, can also be added to the polyolefin compositions, without thereby impairing the protective action of the UV absorber mixtures employed in accordance with the invention.

Preferred is a polyolefin composition wherein the substituent R_1 or R_2 in the compounds of the formula (IIa) is located in the ortho-position or para-position relative to the hydroxyl group.

Also preferred is a polyolefin composition, in which, in the compounds of the formula (IIa), R_1 is hydrogen or alkyl having 1 to 20 carbon atoms, R_2 is hydrogen, alkyl having 1 to 18 carbon atoms or phenylalkyl having 1 to 4 carbon atoms in the alkyl moiety and R_3 is hydrogen, chlorine or alkyl having 1 to 4 carbon atoms. Preference is given to compounds, in which R_1 is in the ortho-position relative to the hydroxyl group and is hydrogen or alkyl having 4 to 12 carbon atoms, R_2 is in the para-position relative to the hydroxyl group and is alkyl having 1 to 6 carbon atoms or cumyl and R_3 is hydrogen or chlorine. More preferably R_1 is alkyl having 8 to 12 carbon atoms, R_2 is alkyl having 4 to 6 carbon atoms and R_3 is hydrogen.

Other preferred polyolefin compositions are those, in which, in the compounds of the formula (IIb), T is alkyl having 1 to 6 carbon atoms, T_1 is hydrogen, chlorine or alkyl having 1 to 4 carbon atoms, n is 1 or 2 and, if n is 1, T_2 is one of the radicals of the formula $-OT_3$ or

- 12 -

and, if n is 2, T₂ is a radical of the formula -O-T₉-O- or

in which T₃ is hydrogen, alkyl having 1 to 18 carbon atoms or alkyl which has 3 to 18 carbon atoms and is interrupted once or several times by -O-, T₄ and T₅ independently of one another are hydrogen, alkyl having 1 to 18 carbon atoms, alkenyl having 3 to 8 carbon atoms or hydroxyalkyl having 2 to 4 carbon atoms, T₆ is hydrogen or alkyl having 1 to 6 carbon atoms, and T₉ and T₁₀ are alkylene having 2 to 8 carbon atoms, alkenylene having 4 to 8 carbon atoms or alkylene which has 2 to 18 carbon atoms and is interrupted once or several times by -O-.

More preferably, in which T is alkyl having 1 to 4 carbon atoms, T₁ is hydrogen or chlorine and T₂ is one of the radicals of the formula -OT₃ or -O-T₉-O- in which T₃ is hydrogen, alkyl having 1 to 12 carbon atoms or a radical of the formula -(OC₂H₄)₄₋₈-H and T₉ is alkylene having 2 to 8 carbon atoms.

Most preferably T₂ is a radical of the formula -OT₃ and T₃ is alkyl having 1 to 12 carbon atoms or a radical of the formula -(OC₂H₄)₄₋₈-H.

A further subject of the invention is the use of a mixture of UV-absorbers as defined above for the stabilization of polyolefins.

The following examples illustrate the invention.

Example 1: Light stabilization of PP homopolymer films

100 parts of unstabilized polypropylene powder (melt flow index 3.2 g/10 minutes, 230°C / 2160 g) are homogenized at 200°C for 10 minutes in a Brabender plastograph with 0.05 parts of pentaerythrityl-tetrakis-3-(3,5-ditert.butyl-4-hydroxyphenyl)-propionate, 0.05 parts of tris-(2,4-di-tert.butylphenyl)-phosphite, 0.1 parts of Ca stearate and the amount of light stabilizer indicated in table 1. The material thus obtained is compression molded in a laboratory press between two aluminum foils for 6 minutes at 260°C to a 0.5 mm thick film which is cooled immediately to room temperature in a water-cooled press. Samples of 60 x 25 mm are cut out of these 0.5 mm films and exposed in a WEATHER-OMETER Ci 65 (black panel temperature $63 \pm 2^\circ\text{C}$, without water-spraying)

Periodically, these samples are removed from the exposure apparatus and their carbonyl content is measured with an infrared spectrophotometer.

The exposure time corresponding to formation of a carbonyl absorbance of 0.1 is a measure for the stabilizing efficiency of the light stabilizer. The values obtained are summarized in the following table (Table 1).
